

1.5 Continuity

Standards:

MCA2

MCA2d

Old Direct Substitution Property

If function f is a polynomial/rational & (a) is in the domain, then

$$\lim_{x \rightarrow a} f(x) = f(a).$$

FACT Functions that applied this property are called continuous at (a) .

new Continuity

Which graph(s) do you think is/are continuous?

Graph #3 is the only one that is continuous. The basic idea for picking a graph to be continuous is drawing the graph without "picking up your pencil".

Calculus Definition of Continuity

A function f is continuous at point (a) if $\lim_{x \rightarrow a} f(x) = f(a)$.

Basically this definition is saying that f is continuous at (a) if $f(x)$ approaches $f(a)$ as x approaches (a) . It is every number in an interval of f whose graph has no break.

3 types of Discontinuities

① Removable Discontinuity

Value is NOT in the domain of the function — the value has been "removed" from the domain.

② Jump Discontinuity

function "jumps" from one value to another

③ Infinite Discontinuity

vertical asymptote is present at (a) .

3 Requirements for a function to be continuous

condition 1: $f(a)$ is defined

condition 2: $\lim_{x \rightarrow a} f(x)$ must exist

condition 3: $\lim_{x \rightarrow a} f(x) = f(a)$.

[Example 1] Let's consider a point that is continuous & use the requirements to prove that is continuous.

Let's look at $x=6$.

- ✓ condition 1: $f(6)$ is defined
- ✓ condition 2: $\lim_{x \rightarrow 6} f(x)$ exist
- ✓ condition 3: $\lim_{x \rightarrow 6} f(x) = f(6)$

3 Requirements for a function to be continuous

condition 1: $f(a)$ is defined

condition 2: $\lim_{x \rightarrow a} f(x)$ must exist

condition 3: $\lim_{x \rightarrow a} f(x) = f(a)$.

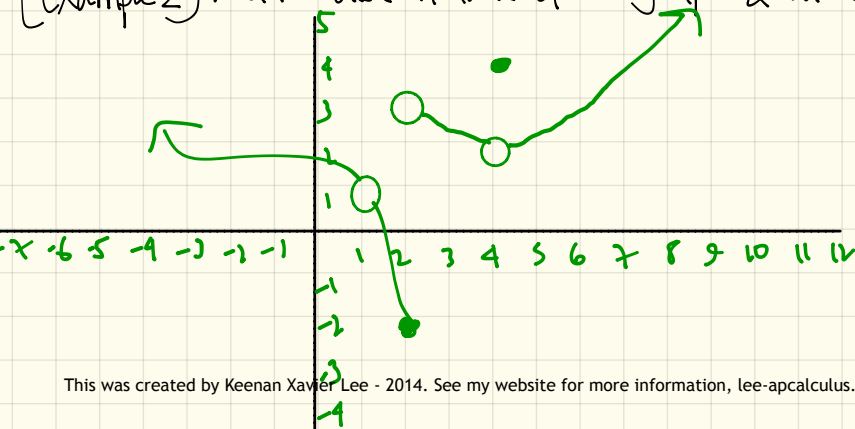

[Example 1] Let's consider a point that is continuous & use the requirements to prove that it is continuous.

$x=6$

- ✓ condition 1: $f(6) = 3$
- ✓ condition 2: $\lim_{x \rightarrow 6} f(x) = 3$
- ✓ condition 3: $\lim_{x \rightarrow 6} f(x) = f(6)$
 $3 = 3$.

[Example 2] Find the discontinuities of the graph & identify reason why.

$$x=1$$

Condition 1: $f(1) = \text{d.n.e}$

$$x=2$$

Condition 1: $f(2) = 2$

Condition 2: $\lim_{x \rightarrow 2} f(x) = \text{d.n.e}$

$$x=4$$

Condition 1: $f(4) = 4$

Condition 2: $\lim_{x \rightarrow 4} f(x) = 2$

Condition 3: $\lim_{x \rightarrow 4} f(x) = f(4)$
 $2 \neq 4$

[Examples] Where are each of these functions discontinuous.
Give a reason why.

$$\textcircled{2} f(x) = \frac{x^2 - x - 2}{x - 2}$$

discontinuous at $x=2$

Condition 1: $f(2) = \text{d.n.e}$

$$\textcircled{3} f(x) = \begin{cases} \frac{x^2 - x - 2}{x - 2} & \text{if } x \neq 2 \\ 1 & \text{if } x = 2 \end{cases}$$

discontinuous at $x=2$

Condition 1: $f(2) = 1$

Condition 2: $\lim_{x \rightarrow 2} \frac{x^2 - x - 2}{x - 2} = \lim_{x \rightarrow 2} \frac{(x-2)(x+1)}{(x-2)}$

$$= \lim_{x \rightarrow 2} x + 1 = (2) + 1 = \textcircled{3}$$

Condition 3: $\lim_{x \rightarrow 2} \frac{x^2 - x - 2}{x - 2} \neq f(2)$

$$3 \neq 1$$

One-sided Continuity - The basic idea is the same except we are looking for continuity of one side of the value, rather than both sides.

Definition:

• A function f is continuous from the right if $\lim_{x \rightarrow a^+} f(x) = f(a)$.

• A function is continuous from the left if $\lim_{x \rightarrow a^-} f(x) = f(a)$.

[Example 4]

a) Is $x=1$ continuous from the left? no

$$\lim_{x \rightarrow 1^-} f(x) = f(1) \\ 1 \neq \text{d.n.e.}$$

Is $x=1$ continuous from the right? no

$$\lim_{x \rightarrow 1^+} f(x) = f(1) \\ 1 \neq \text{d.n.e.}$$

b) Is $x=3$ continuous from the left? yes

$$\lim_{x \rightarrow 3^-} f(x) = f(3) \\ -2 = -2$$

Is $x=3$ continuous from the right? no

$$\lim_{x \rightarrow 3^+} f(x) = f(3) \\ 3 \neq -2$$

[Example 5] Sketch the graph of the function with the following conditions.

$$\lim_{x \rightarrow -3^-} f(x) = \infty$$

$$\lim_{x \rightarrow 5^+} f(x) = \infty$$

$$f(1) = 2$$

$$\lim_{x \rightarrow 1} f(x) = 3$$
